

Interior Door Controller

Procure's network door controller provides secure access for an interior door. The door controller connects to your router and works together with a Check-In Computer and electric door strike (or maglock). When a child or employee is checked in, a signal is sent to the door strike to allow entry. The door controller is available directly from Procure, while the door strike would be obtained and installed by a local security or door company.

Center Security

Interior door controls provide added security to your center, as you are able to manage who can unlock designated doors using a check-in/out computer or Procure Touch device. Assign authorized drop-off and pick-up people and/or employees within Procure Solutions to be able to open designated doors—providing zone control access and the ability to remove access for anyone at anytime.

Imagine the added peace of mind knowing that your classrooms are always secure. No more accidentally leaving the door unlocked, wrestling with keys, or deferring focus to the door and away from the kids.

Specs and Features

Rated	120 VAC @5amp dc@5amp Supports ipV4 Networks (Does not support ipV6)
Environment	Interior Use Only

NOTE: Customer supplies additional range extending equipment if needed.
